

ONE CITY, ONE STORY

Scientists suggest vibrations of a butterfly's wings in Brazil might disturb the atmosphere,

eventually lead to a tornado in Texas:
Small changes leading to large-scale effects.

Just imagine what a few thousand people reading the same book could do.

Everyone at a different place in the story.
Reading to themselves, reading out loud to someone.

But pages turning, slow or quick. Now and then, half the night. But always turning,

bringing up questions, starting a dialogue that thrives.

Thousands of people with the same book in their hands. Happily disturbing the atmosphere.
